

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (Original): A flat microlens wherein:

 said microlens is formed using a transparent DLC film;

 said DLC film includes a region with graded refractive indices; and

 when a light beam passes through said region with graded refractive indices, said light beam is focused.

Claim 2 (Original): A flat microlens according to claim 1 wherein:

 a refraction lens region with a relatively high refractive index is formed on a first main surface of said DLC film; and

 said lens region includes a convex lens formed from said first main surface and a surrounding boundary surface corresponding to part of a roughly spherical surface.

Claim 3 (Original): A flat microlens according to claim 1 wherein:

 a refraction lens region with a relatively high refractive index is formed on said first main surface to correspond with each of said microlenses; and

 said lens region has a shape of a columnar convex lens formed from said first main surface surrounded by a boundary surface corresponding to a part of a roughly cylindrical surface with a central axis parallel to said main surface.

Claim 4 (Currently Amended): A flat microlens according to claim 1 wherein:

 a refraction lens region with a relatively high refractive index is formed on said DLC film corresponding to each of said microlenses;

 said lens region has a roughly cylindrical shape that passes completely through said DLC film; and

a central axis of said cylindrical shape is perpendicular to said DLC film, with higher refractive indices near said central axis.

Claim 5 (Currently Amended): A flat microlens according to claim 1 wherein:

a refraction lens region with a relatively high refractive index is formed on said DLC film corresponding to each of said microlenses;

said lens region is a band-shaped region passing completely through said DLC film; and

refractive indices are higher near a plane passing through a midpoint of a width axis of said band-shaped region and perpendicular to said DLC film.

Claim 6 (Original): A flat microlens according to claim 1 wherein:

said DLC film includes a plurality of concentric band-shaped ring regions;

refractive indices of said band-shaped regions are graded relative to each other so that said band-shaped ring regions act as a diffraction grating; and

widths of said band-shaped ring regions decrease as a distance from a center of said concentric circles increases.

Claim 7 (Original): A flat microlens according to claim 6 wherein:

said DLC film includes m concentric ring zones, each of said ring zones containing n band-shaped ring regions;

in each of said ring zones, inner band-shaped ring regions have higher refractive indices than outer band-shaped ring regions; and

corresponding band-shaped ring regions in different ring zones have identical refractive indices.

Claim 8 (Original): A flat microlens according to claim 1 wherein:

said DLC film includes a plurality of parallel band-shaped regions;

refractive indices of said band-shaped regions are graded relative to each other so that said band-shaped regions act as a diffraction grating; and

a width of said band-shaped region decreases as a distance from a predetermined band-shaped region increases.

Claim 9 (Original): A microlens according to claim 8 wherein:

 said DLC film includes m concentric band zones, each of said band zones containing n band-shaped regions;

 in each of said band zones, band-shaped regions closer to said predetermined band-shaped region have higher refractive indices than band-shaped regions that are further away; and

 corresponding band-shaped regions in different band zones have identical refractive indices.

Claim 10 (Previously Presented): A flat microlens according to claim 1 wherein said microlens can act as a lens for light containing wavelengths in a range from 0.4 microns to 2.0 microns.

Claim 11 (Previously Presented): A method for making a flat microlens according to claim 1 wherein said DLC film is formed using plasma CVD.

Claim 12 (Original): A method for making a flat microlens according to claim 11 wherein a refractive index of a region in said DLC film with a relatively high refractive index can be formed by increasing refractive index through application of an energy beam to said DLC film.

Claim 13 (Original): A method for making a flat microlens according to claim 12 wherein said energy beam application can include ultraviolet radiation, X-ray radiation, synchrotron radiation, ion beam radiation, and electron beam radiation.

Claim 14 (Previously Presented): A method for making a flat microlens according to claim 12 wherein a plurality of microlenses arranged in an array on a single DLC film is formed simultaneously by applying an energy beam.
